Found in Europe and North America, it was described as new to science in 1994 by Swedish mycologist Leif Ryvarde. Description The fruit bodies of Chrysopilus furvus have caps that measure in diameter. Initially convex before flattening out in maturity, they are smooth or have faint cracks on the surface. The caps have up to six (rarely seven) developing pores, which are round, measuring 0.5–1.5 mm in diameter. The pores themselves are white to pale yellowish-brown in color, and may have a faint yellow tinge to them. The pore surface is initially

curved but flattens out into a reticulate pattern once the pore surface matures. The tubes are long. The flesh is thin and has a dense network of white threads. The tubes are filled with thick-walled, fusiform to subcylindrical basidiospores measuring 4–5.5 by 2–3  $\mu\text{m}$ . The fungus has a dimitic hyphal system. Its hyphal system consists of both generative and skeletal hyphae. The generative hyphae have clamp connections. The basidia (spore-bearing cells) are club-shaped and four-spored. Their dimensions are typically 7–15 by 3.5–5  $\mu\text{m}$ . The basidiospores have deltoid shapes, and are hyaline (translucent), thin-walled, and measure 4–5 by 2–3  $\mu\text{m}$ . Habitat and distribution *Chrysopilus furvus* has been found in North America and Europe. It has been recorded from New Brunswick a1d647c40b
