AutoCAD is a commercial desktop application for 2D drafting and design, and is designed to be useful for

architecture, civil, mechanical, electrical, landscape, and many other fields. AutoCAD is capable of performing traditional 2D drafting tasks as well as creating 2D and 3D drawings. The application uses parametric modeling to enable the rapid creation of an unlimited number of complex drawings. Today, the application is used by millions of architects, engineers, landscape architects, and civil, mechanical and electrical engineers. Elements in the AutoCAD interface (Figure 1) consist of the AutoCAD application window, the Ribbon interface, palettes, the drawing and drawing components, and the

document components. We've also made changes to how you can edit drawing properties using the Properties tool and Property Manager (1:13 min). Fillet and Round Edges:

The Fillet command lets you round your drawings to any desired radius. You can use a property to specify any desired fillet radius, or you can simply enter any radius desired, and the Fillet command will produce the drawing with the desired radius. In addition, we've added an option to let you automatically determine the fillet radius based on your drawing size. Round edges can also be created without the use of the Fillet command. When you drag a Line or Polyline object to a point, the object will automatically be rounded to that point. Partial Drawing Updates: Edit, delete, or split your drawing in real-time while you draw.

You can instantly and easily make changes to your drawing while you draw. Updates can occur during part of the drawing creation process. Multiple Views, Side-by-Side: Multiple views in 2D and 3D models and multiple simultaneous side-by-side views are now available. The new multiple view interface displays a preview of each different view that you specify in the Multi-View dialog box. By default, the preview can show any view or views that you have enabled. You can show or hide a specific view by changing the View/Display selection in the Multi-View dialog box. Multiple views also allow you to compare different views

and views of the same view. This can be helpful when you need to make decisions based on data being viewed in different views. For example, in a view of the front elevation, you might want to change the view of a part of the drawing from Plan to Elevation.

Alternatively, you can create a side-by-side view of the front and back elevations. All new 2D and 3D view settings now use the new multiple view interface. In our previous View dialog, the property table for each view you specified was displayed only for that view. The new multiple view interface displays all view properties and editing properties that you specify for each

view. The property table for each view displays values for all properties that are displayed in that view. For example, if you specify a Properties tool in the preview for a view, the properties available in that view are listed in the property table for that view. We also added a “Hidden
