Read more: What's New: - Added option to export text within the selected database. - Added option to copy and paste the output to your clipboard. - Enhanced application screenshot DBFConverter is a tiny little application that provides you with the means to quickly convert your dBase database files to several formats, so you can integrate them in other projects as well. Portable application Right off the bat, it needs to be mentioned that DBFConverter does not require any installation, so you can run it out of the box as soon as you unpacked its package. You can also copy it on a removable USB drive, then run every time you work on a shared computer and you need to convert your DBF files. User-friendly dBase conversion DBFConverter is straightforward and intuitive, as it makes it very easy even for novices to load the files they want to convert. The only way to load the DBF files within the main window is to manually browse to their location, as drag and drop operations are not supported. An entire folder needs to be selected, then it gets automatically scanned and all detected DBF files are added. When it comes to converting data to JSON or XML, no additional parameters need to be adjusted, so the process is completed within seconds. Convert dBase to SQL Server databases If you are interested in exporting your dBase data to a different database, you first need to enter all the details related to the destination. More specifically, you need to enter the name of the SQL Server database, the prefix and the DB hostname, as well as the corresponding username and password. To wrap it up All in all, DBFConverter can help you save time and effort when you need to quickly convert your dBase data to other formats. While experts might prefer apps that provide them with more customization options and control during the conversion process, less experienced users are bound to appreciate the utility's simplicity and ease of use.

I want to get a transaction ID from the server via a POST request. I want to make an individual POST request, wait for a response, save the transaction ID in a variable and begin the transaction so that I can apply the transaction to my existing application through a PUT request. I am new to GAE and I thought about using one of the tools suggested here, but as far as I can tell that will require a library that is not built-in to GAE. Is there any way I can accomplish this without relying on an external library (such as an external database for Persistence)? A: GAE doesn't support transactions, this is a shortcoming that will be changing. I don't know of any specific way of doing what you want. You could keep a a set of pk values that you keep updating, and keep a seperate list of the updated values. You can

write a transaction handler that takes a put object, and updates the pks appropriately, then saves the pks themselves. Another handler running at the same time could check if the pks and the updated pks are the same, and if so, apply the update.

Something like this (untested):

```
class appenginehandler(webapp.RequestHandler):
    def get(self):
        # pks already loaded
        pks = [self.request.get("transaction_pk_%i" % i, None) for i in range(1000)]
        # submit transaction
        # for i, pk in enumerate(pks):
        pks[i] = pk
        # update pks in the DB # 6a5afdab4c
```
