In order to provide a semiconductor device having higher density, it is important to realize a technology for improving the characteristics of fine patterns such as line width and spacing. A focus of the integration level is shifted from the MOS transistor to the capacitor. The capacitor is also required to have higher integration, higher capacity, and a smaller area. As an example of a structure of the capacitor to realize such a characteristic, a trench capacitor using a trench isolation region as a structure for isolating elements is known. The structure of the trench capacitor is explained with reference to FIGS. 5A, 5B, and 5C. FIGS. 5A and 5B are plan views of the structure of the trench capacitor, and FIG. 5C is a cross sectional view taken along a line A-A' in FIG. 5B. The structure shown in FIGS. 5A, 5B, and 5C will be explained below. Referring to FIG. 5A, a trench isolation region 103 is formed on a substrate 101. A plurality of trench patterns 104 is arranged in the substrate 101 so that the trench isolation region 103 is formed therebetween. Then, an oxide film 105 which fills the trench patterns 104 is formed so as to cover the inner wall of the trench patterns 104.
