GIMP For those of you old enough to remember the caveman-like look of the 1990s, the image shown in Figure 4-6 was created on a computer running the GIMP, the free open source alternative to Photoshop. FIGURE 4-6: The GIMP (Go Image Manipulation Program) is a fast, free, and easy-to-use alternative to Photoshop. You can download GIMP from `www.gimp.org`. Unlike Photoshop, which has layers, GIMP uses a bitmap-based workflow and also lacks layers. Thus, you can't create and alter images with layers. However, you can make tons of other edits to images in GIMP using the same techniques you use in Photoshop. GIMP is a fast program with a simple interface, shown in Figure 4-6. It does have a few rough edges, but you can still use GIMP to edit photos of all types.

The effect of apolipoprotein E gene polymorphism on the amyloid deposits and cerebrovascular amyloidosis of sporadic cerebrovascular amyloidosis with atherosclerotic lesion. To investigate the relation between apolipoprotein E (apoE) polymorphism and the amyloid deposits and cerebrovascular amyloidosis (CA) with atherosclerotic lesion, the apoE genotypes of the sporadic CA with atherosclerotic lesion were compared with those of the controls. The apoE genotypes of 39 patients with the sporadic CA were the same as those of the control group; however, those of the 9 patients with the sporadic CA who had atherosclerotic lesion tended to be a little higher than those of the control group. The apoE genotype of the patients with the sporadic CA was not correlated to the location of the atherosclerotic lesions of CA. These results suggest that sporadic CA with atherosclerotic lesion would be a different group from classical CA. Effects of ankle joint stiffness and eccentric contraction on neuromuscular activity during gait. This study investigated the influence of an increased mechanical stiffness of the ankle joint and increased eccentric contraction on the muscle activity of the lower leg muscles during gait. Muscular activity was evaluated by surface electromyography (EMG), measuring the activity of tibialis anterior, gastrocnemius lateralis and medialis, and vastus lateralis and medialis. The EMG signals were classified by means of peak amplitude, length of the electromyographic bursts, and number of bursts. The results indicated that an increased stiffness of the ankle joint at the beginning of the stance phase resulted in a decreased activity of tibialis anterior during the early stance phase. In the late stance phase, increased eccentric contraction of the ankle joint resulted in an increased activity of gastrocnemius medialis. The increased ankle stiffness reduced the activity of tibialis anterior. It is hypothesized that an increased mechanical stiffness of the ankle joint during gait may be an effort to compensate for instability. Therapeutic strategy for childhood T-cell acute lymphoblastic leukemia based on gene expression profiling. Gene expression profiling is a powerful tool for exploring disease subtypes and designing treatments. We analyzed the gene expression profiles of 35 children with T-cell acute lymphoblastic leukemia (T-ALL) to define 5 distinct molecular subgroups of childhood T-ALL.
