Working with the Add-In:
You work with the Add-In
like you do with any
other editor. The only
difference is that the
standard functionality is
not located in the Project
Explorer, it is located in
the Add-In bar in the
Visual Studio IDE. But
you can quickly switch
between project explorer
and add-in bar by
Alt+Insert key
combination How to use
the add-in: Once
installed, you will find it

under the Tools menu in Visual Studio. If you still miss it, you can also access it under the international menu as suggested in my previous post

$$\frac{\alpha(\alpha-1)\dot{E}^2}{2L_1} + \frac{a(1+\kappa)\dot{E}^2}{2L_1} \left[\left(\frac{\delta_1 - \delta_2}{L_1} \right)^2 - \frac{1}{L_1} \right]$$

For large δ_2 , as the term δ_1^2 grows linearly with δ_2 and the term

$1/L_1$ grows with $1/\delta_2$ we can expect that R decreases with $1/\delta_2$. On the other hand, since L_1 is related to the local mass density, the coefficient α , β and a grow linearly with δ_2 . Then R decreases less rapidly than $1/\delta_2$. From now on, we fix $a = \alpha = \beta = 2$ and evaluate the ratio R at $R = 0.01$ for various L_1 . We first

show the result in the case of only the k -th term being present. We

-Support for the development of applications in any combination of the following languages:

-Java (Java 1.4 and later): Java is an object-oriented, multi-threaded, high-level programming language developed by Sun Microsystems, in part as an alternative to C++.

-C# (Visual Basic): C# is a multi-paradigm,

statically type safe, compiled, object-oriented programming language developed by Microsoft, which is an implementation of the language of the same name.

-Visual Basic: Visual Basic is a BASIC variant developed by Microsoft that is used in Visual Studio

-Matlab: Matlab is an open-source numerical and matrix analysis programming environment for creating applications that use numerical methods and algorithms, derived from

Simulink and finite element analysis

-Fortran: Fortran is a high-level, general purpose, imperative, numerical programming language that is one of the most widely used scientific programming languages.

-PowerBuilder:

PowerBuilder is a development environment for creating client and server applications for the Microsoft Windows operating system. It is a Microsoft product and

was developed to help IBM and other developers create applications for Windows.

- J++: J++ is a C-like programming language with Java-like syntax that is freely licensed by Sun Microsystems and JavaSoft.
- C++/CLI: C++/CLI (pronounced clangine) is the extended C++ language that is a combination of C++ and the .NET framework.
- Mathematica: Mathematica is a

professional level, object oriented, interactive computing environment for use with programs written in Mathematica. It is an add-in for Mathematica 6. -Maple: Maple is a general-purpose computer algebra system and programming language. -HTML, XML, XSL, XQuery, XSD, CSS: HTML (Hypertext Markup Language) is the de facto standard for creating Web pages. It is derived from Standard Generalized Markup

Language (SGML). XML (eXtensible Markup Language) is a language for describing an object oriented tree. XQuery (eXtensible Query Language) is designed to be a query and update language for XML. XSD (eXtensible Schema Language) is a language for describing XML documents. CSS (Cascading Style Sheets) is a language for describing the presentation of XML documents. -OpenOffice (OpenOffice.org,

This is the world's first multi-language development tool that supports ASP.NET, windows application, and Compact Framework development. It supports simplified and natural language translations through the Visual Studio.NET IDE. The localization engine in the tool allows creating translations for entire projects or for specified folder/files in projects. There is no need to start

with a separate project with your language messages. Please see the website for a complete description of the product and a full list of features: Fixes a problem that sometimes causes the IDE to stop responding and become unresponsive. This fix will not fix the problem if you receive a message on the IDE for another reason. Fixes a problem that causes the IDE to stop responding and become unresponsive. The fix will not fix the

problem if you receive a message on the IDE for another reason. With globalization fast becoming a reality, you need to be able to build your applications no matter what language and culture the user resides in. The Multi-Language Add-in for Visual Studio 2005 and 2008, is a complete solution to the needs of translators and international/multilingual developers. The product is an Add-In for Visual Studio, which

means that it is tightly integrated into the development environment itself. The localization support is based on the built in localization support in Visual Studio and in the .NET environment.

What's New in the Multi-Language Add-In?

The Multi-Language Add-

In gives you full access to multiple language localizations and translations of your application, regardless of the target system in which your application runs. The product contains a technology called "translation memory" that intelligently combines information from all supported languages to provide quick access to the correct translation for any supported locale. The Multi-Language Add-In has a rich set of

features including: ·
Localization support for
Windows Forms,
ASP.NET Web
applications, and
Compact Framework
applications · Support for
multiple resource files
(text files) per
application · Allows
developers to access the
local resources of any
supported system
through the native
language resource
access API · Ability to
perform large-scale
validation on resources
before they are exported

- Supports the globalization concept of using translated messages without increasing application size
- Ability to reuse localized resources from one application on multiple system resources
- Allows you to have different language localizations for each installed language of a program (very useful for internationalized applications)
- Provides access to user-defined properties to provide custom support for

localization · Provides automatic support for resources based on date formatting (such as `DateTime` field) · Supports custom format strings for formatting (such as `Currency` field) · Direct access to the code which you can use to validate and convert text values yourself · Ability to define local values and use them in localized resource files · Use internationalized properties for user interface and throw custom exceptions for

invalid strings · Provides automatic support for font substitution (very useful for internationalized applications) Multi-Language Add-In

Limitations: Although the Multi-Language Add-In is built for applications which support localization, there are a few limitations. These include:

- The product does not support any case variants (upper and lowercase) ·

Internationalized strings (such as a "Message for"

string in a message file)
are case sensitive ·
Strings with date
formatting (such as
DateTime) are case
sensitive · Strings which
contain a period are
case sensitive · This
product does not
support right-to-left text
and does not support
code page and other non-
ASCII text · This product
does not support
creating
internationalized
applications on any
system other than
Windows.

Internationalizing your Applications: The Microsoft.NET Framework 2.0 provides many benefits and features to developers. It is a major upgrade to all versions of.NET Framework, and provides a new language infrastructure for building applications. Microsoft decided to take advantage of this new
