While the term "database" is being used, it is understood that the term "database" is also used to refer to a data store or data store server. Database files may become corrupted in various ways. Information in a database may be lost due to system failure or user error. For example, a user could delete, copy, or move a file with database information in the file. If a database file is deleted, the database file may not be fully removed and may be referenced by other files or by a file system. Databases may be protected to prevent information from being accidentally or deliberately deleted or corrupted. For example, a backup procedure may be performed to make a copy of a database file. The copy is stored at a separate location that is typically at a different point in time than the original copy. A user may be able to access and modify the copy without having access to the original copy. Thus, if a user wants to destroy the copy in the event that the copy has become corrupted, the copy is typically destroyed at the same time that the original is destroyed. In the past, it was typically required to ensure that all copies of a database file were destroyed at the same time. As a result, it was often necessary for a user to ensure that the copies of the file were not accessible until the original file was fully deleted, ensuring that the copy would be destroyed when the original file was destroyed. For example, in a traditional backup process, a copy of a database file is created at a time prior to the backup. The copy is kept in a separate location, separate from the time in which the original copy of the file is kept. If the user wants to destroy the copy in the event that the copy has become corrupted, the user must ensure that the copy is destroyed at the same time as the original copy. If the copy is not destroyed at the same time as the original copy, the copy may remain available even after the original is fully destroyed. In some cases, the copy is not accessible until it is deleted in a safe manner, such as by securely erasing the file (e.g., overwriting the data with data that is not recognizable as data of
